WORLD POPULATION TRENDS AND PROSPECTS BY COUNTRY, 1950-2000:
Summary report of the 1978 assessment

UNITED NATIONS
New York, 1979

NOTE

The designations employed and the presentation of the material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

The term "country" as used in the text of this publication also refers, as appropriate, to territories or areas.

In some tables, the designations "more developed" and "less developed" regions are intended for statistical convenience and do not necessarily express a judgement about the stage reached by a particular country or area in the development process.

Symbols of United Nations documents are composed of capital letter combined with figures. Mention of such a symbol indicates a reference to a United Nations document.

PREFACE

Since the United Nations has so far published its demographic assessments on the current and future world population trends six times, in 1951, 1954, 1957, 1963, 1968 and 1973, the new assessment of the global, regional and country populations presented in this report are the results of the seventh round of such attempts, carried out on the basis of demographic data which had become available by the end of 1978. Although the major responsibility of the present revision rests with the United Nations Secretariat, the work is the product of close co-operation among the United Nations bodies, especially with the regional commissions.

The results of the new estimates and projections will be published in a series of reports, of which this is the first. These include:

Selected World Demographic Indicators by Countries, 1950-2000 (Series R), 1979;

Age-Sex Composition of Population by Countries, 1950-2000 (Working Paper), 1979;

Long-Range Projections of Populations, 1975-2150 (Working Paper), 1979;

World Population Prospects as Assessed in 1978 (Series A), 1980.

Discussion concerning estimation, future assumptions and other methodological issues, in addition to the summary of the findings, will be included in the last report in the above list. Magnetic tapes containing the major assumptions and results of the new estimates and projections will also be provided, upon request, later this year.

METHODS AND ASSUMPTIONS

The new population estimates and projections presented in this report are prepared, as in the previous projections, for such geographical units as the world, the more developed regions, the less developed regions, eight major areas and 24 regions,1/ in addition to 210 countries and territories and areas. Estimates and projections are provided for each quinquennial year or each quinquennial period between 1950 and 2000. The present work is a revision of the previous demographic assessment prepared by the United Nations Secretariat in 1973, taking account of new data, studies and national estimates which have become available since then.

As in the past, four variants of projections are prepared: the medium, high, low and constant variants; selected results of the first three variants are presented in this report. Distinctions among those variants are mostly due to the differences in assumed future fertility rates; however, different assumptions are also adopted on future mortality and migration rates when such differentiations seem appropriate. In general, the medium variant represents future demographic trends which seem more likely to occur in view of observed past demographic trends, expected social and economic progress, ongoing government policies and prevailing public attitudes towards population issues. On the other hand, the high and low variants respectively indicate the plausible, but not exhaustive, range of future deviations from the medium variant projections, since future fertility, mortality and migration rates could take alternative courses under various conditions. As usual in United Nations projections, no catastrophes such as wars, famines and epidemics which would inevitably affect demographic trends are assumed in formulating those future assumptions.

The basic method of projection used here is the cohort component method2/ in which the population of each country classified by age and

---

1/ For convenience in presenting global demographic trends, the Population Division of the Department of International Economic and Social Affairs of the United Nations Secretariat has been using the three levels of country classification mentioned in the text, of which the last two are essentially geographical groupings. The bisection of the 24 regions into the "less developed" and the "more developed" regions has also been made on the basis of demographic and other social and economic indicators. The less developed regions include all regions of Africa, Asia (excluding "Japan"), Latin America and Oceania (excluding "Australia and New Zealand"). The more developed regions include all regions of Europe, the Union of Soviet Socialist Republics, Northern America and the regions just cited as being outside the less developed category. In Latin America, "Temperate South America", which was formerly included among the more developed regions, is currently included among the less developed regions.

2/ Manual III: Methods for Population Projections by Sex and Age (United Nations publication, Sales No. 56.XIII.3).

sex for the base year of 1975 is projected forward on the basis of assumed future fertility, mortality and migration rates. More specifically, it involves the following steps:

(a) Census and survey data concerning both the sex-age structure of the population and the levels and trends of fertility, mortality and international migration are collected and evaluated; adjustments are made as needed to arrive at acceptable measures of fertility, mortality and net migration as well as the age-sex structure of the base-year population which is compatible with other demographic measures;

(b) Assumed age- and sex-specific survival rates which are usually computed from various model life tables are successively applied to the starting population to estimate the number of survivors to the end of each five-year period;

(c) Assumed age-specific birth rates are applied to the corresponding numbers of females in the reproductive age groups to estimate the number of births; these births are distributed by sex according to an assumed sex-ratio at birth; then the number of survivors from these births at the end of each five-year period are estimated by using survival probabilities;

(d) The amount of net migration, if any, is estimated and incorporated into the projected figures.

This cohort component method of projection is used for all countries with population of 250,000 or more as of 1975. For smaller countries with less than 250,000, only total population, instead of population by sex and age groups, is projected by applying assumed rates of population change.

As mentioned above, fertility assumptions have been prepared taking into consideration past and present fertility trends in each country. For countries with currently high fertility, it is generally assumed that (a) there will be a fertility decline as economic and social development takes place; (b) existing or anticipated government policies and programmes as well as non-governmental activities aimed at such a goal will expedite the process of fertility decline; and (c) once the decline begins, it will begin slowly, gain momentum and then slow down its speed again. On the other hand, for those countries with fertility levels near or below the replacement level, it is assumed that fertility will begin to converge into a replacement level before the end of this century.

With respect to mortality trends, a quinquennial gain of 2.5 years in the expectation of life at birth is assumed until it reaches 55 years, followed by a slowdown of the gain thereafter. However, the assumed future quinquennial gains are lowered to 2.0 years or 1.5 years, instead of 2.5, for some developing countries where recent evidence indicates a retardation of improvement in mortality levels. On the other hand, for those countries where life expectation has already reached a high level the maximum level

of life expectancy that could be reached is increased to 73.5 years for males and 80.0 years for females in accordance with recent statistical records in some developed countries.

Largely owing to the difficulty of anticipating the future of international migration, the volume of net migration - if there is any at present - is assumed to diminish progressively with the passage of time unless there are strong indications that the present level of migration will be sustained for a considerable time to come.

Although population estimates and projections presented in this report are provided mostly for each quinquennial year, estimates and projections of annual mid-year populations which are consistent with the medium variant of the projections are also presented in Annex Table 1-C. The annual figures for the period 1950-1975 are taken from official national estimates where reliable estimates are available. However, if no such estimates are available, and also for the period 1975-2000, an osculatory interpolation formula, namely Beer's six-term ordinary formula, is used to interpolate the quinquennial figures.

RESULTS

According to the new estimates and projections, the world total population of 4,033 million in 1975 is now projected to reach 6,199 million in the year 2000, which is about 55 million below the previous projection prepared in 1973. This downward adjustment is the net result of two factors: (1) a downward adjustment of projected fertility rates which reflect the recent declines observed in some countries, both developed and developing, and (2) an upward adjustment of the bench-mark population of 1975 by 65 million, a large portion of which is due to the upward revision of the Chinese population in 1975 from 839 to 895 million.

The above assessment indicates that a rapid growth of the world population is still very much under way. At the same time, however, there is a sign of change in growth trends which may not be so profound now and in the near future but could be quite significant in a longer historical perspective. As it appears now, the period of the most rapid growth of the world population has already passed and the world population is going to increase at a slowly declining rate. According to the revised estimates, the annual growth rate of the world population today is 1.8 per cent which is below the highest level of about 2.0 per cent estimated for 1960-1965. The rate is expected to continue its decline, slow at the beginning, accelerating later, and reaching 1.5 per cent at the end of the century (table 1).

If demographic trends of the world are observed separately for more and less developed regions, the current rates of population growth in both bisections are somewhat lower than the rates estimated by the United Nations in 1973 for the same period. For the less developed regions as a whole, the annual growth rate in 1975-1980 is revised downwards from 2.36 to 2.21 per cent; for the more developed regions it is revised from 0.82 to 0.67 per cent. These changes further led to the downward revision of future growth rates: from 1.94 to 1.84 per cent for the less developed regions and from 0.59 to 0.51 per cent for the more developed regions towards the last quinquennial period of this century (table 2).

If the bisection of the world mentioned above is kept unchanged, the percentage of the world population living in the less developed regions, which is 72.9 per cent in 1975, will increase to 79.5 per cent while the

Among the eight major areas of the world, the most rapid population growth for the quarter century period of 1975-2000 is projected for Africa. The estimated average annual growth rate of 2.91 per cent for 1975-1980 will go up to 2.97 in 1980-1985 and then begin to decline to reach 2.64 per cent in 1995-2000. The projected growth rates are slightly lower in Latin America than in Africa where the rate is going down from 2.66 per cent in 1975-1980 to 2.34 per cent at the end of the century. The lowest average annual growth is expected in European countries where in 1975-1980 it is about 0.39 per cent. In effect the growth rate for the region will not change significantly during the whole period from 1975 to 2000 (table 4).

Less developed regions

One of the most prominent features of the recent demographic trends among the less developed regions is the increasing diversity in the rate of population growth. While the combined population of the less developed regions is projected to increase from 2,940 million in 1975 to 4,926 million in 2000, the differences in the estimated growth rates are very uneven among the regions. There are two regions whose average annual growth rates exceed 3 per cent for almost the whole period from 1975 to the year 2000: Middle America and Western Africa. On the low side there are three regions with average annual rates less than 2.0 per cent: Caribbean, Temperate South America and China. The other 11 regions have average annual rates between 2.0 and 3.0 per cent (table 5).

The divergence in the recent growth rates of population has apparently been caused by the differential fertility trends among the less developed regions. Since the mortality rate has been and will continue to be decreasing in the long run, a very small decline or no decline in fertility from its high level means that there will most likely be an increasing population growth rate, as in African regions. On the other hand, a natural growth rate can be decreased when a rapid decline in fertility takes place. And such a rapid fertility decline has apparently occurred in East Asia and the Caribbean regions, where fertility levels had originally been below the average of the less developed regions. In a sense, the four regions, namely China, Other East Asia, Caribbean and Temperate South America appear to be diverging from the rest of the less developed regions in terms of growth trends and approaching such a low level as has been recorded recently in some more developed regions like Southern Europe.

However, some important changes that are taking place among the regions with high growth rates should not be overlooked. If the revised growth rates for 1975-1980 are compared with the old estimates of 1973 for the same period, the new estimates will be found to be lower than the old ones in many of these regions. Such downward adjustments, which reflect faster fertility decline than anticipated five years ago, have been made for Tropical South America, Eastern South Asia, Middle South Asia and Micronesia-Polynesia (table 6).

The new projections show a continuous decline of growth rate of the total population in the less developed regions for the coming 25 years, leading to a total population of 4,926 million for the less developed regions at the end of this century. Although this figure is about the same as that projected in the previous projections prepared in 1973, it is nevertheless significant because of the larger 1975 base population used in the new projections. The increase in the base year population by 65 million is mostly due to the reassessment of current populations for China, India, Bangladesh and some African nations. In fact, if there were no change in the base population, the new projected population for the less developed regions in the year 2000 would have been smaller than the old one by more than 100 million, reflecting a faster decline of growth rate in those regions than previously assessed.

More developed regions

The total population of the more developed regions is estimated at 1,093 million in 1975 and projected to increase to 1,272 million in 2000. Its average growth rate for 1975-1980 is estimated as 0.67 per cent per annum which is less than one third of the average for the less developed regions. This low growth rate is also significant in the light of the demographic history of those regions in the last 25 years. The rate of population increase in the more developed regions as a whole, which used to be more than 1.3 per cent per year in the 1950s, began to decrease in the 1960s declining to 0.91 per cent in 1965-1970. It appeared earlier as though the rate of increase had reached a nadir of 0.9 per cent in the first half of the 1970s but, rather unexpectedly, it further declined to around 0.7 per cent in the latter half of the present decade. Unless the observed continuous decline in the fertility rate among the more developed regions, except for the USSR and Eastern Europe, combined with declining immigration should drastically reverse,the gradual decline in the growth rate would probably continue. According to the new projections, the rate is to drop to 0.51 per cent by the end of this century. The validity of this supposition, however, remains to be seen.

Among the more developed regions the lowest rates of population growth are found in Northern and Western Europe where the average annual rates for 1975-1980 are 0.08 and 0.03 per cent respectively. However, the rates of population growth for these two regions are projected to recover in the 1980s, reaching 0.22 and 0.28 per cent respectively by the end of the century (table 7).

Although recent population trends among the more developed regions are strongly affected by fertility and migration trends, it should be noted that life expectancy in several more developed regions seems to have begun a further increase in recent years after a decade of apparent stagnation in the 1960s. However, the immediate effect of this improvement is concealed behind the small rise in the crude death rate due to the aging of the populations (table 8).
